Motivation

Integrative Model of Organizational Behavior

Motivation

- **Motivation** can be defined as exerting a particular effort level (intensity), for a certain amount of time (persistence), toward a particular goal (direction).

Motivation and Effort

Intensity

How hard a person tries

Direction

Is the effort channeled in a beneficial direction?

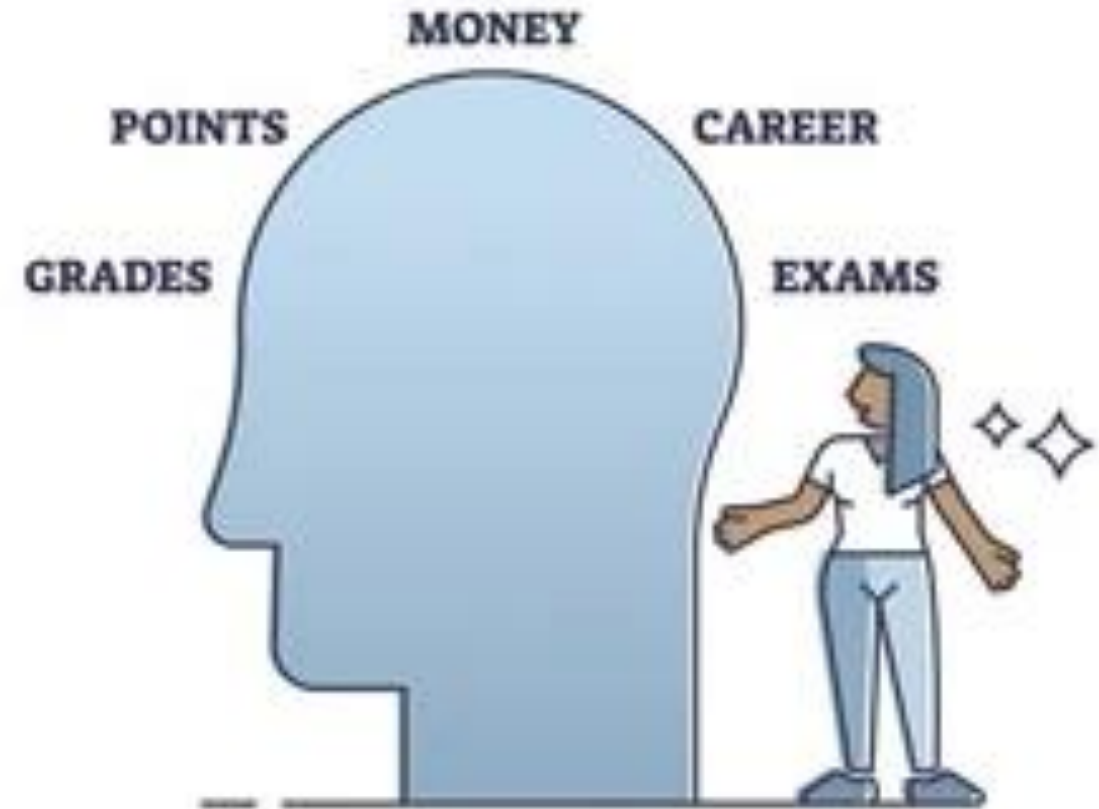

Persistence

How long the person can maintain his/her effort

Autonomous

**INTRINSIC
MOTIVATION**

**EXTRINSIC
MOTIVATION**

Controlled

Motivation Theories

There are different theories explaining why some employees are more motivated than others. Some of these theories are:

Need Theories:

- Maslow's Hierarchy of Needs Theory
- ERG Theory
- McClelland's Theory of Needs

Other Theories:

- Expectancy Theory
- Goal Setting Theory
- Equity Theory
- Self-Efficacy Theory, ...

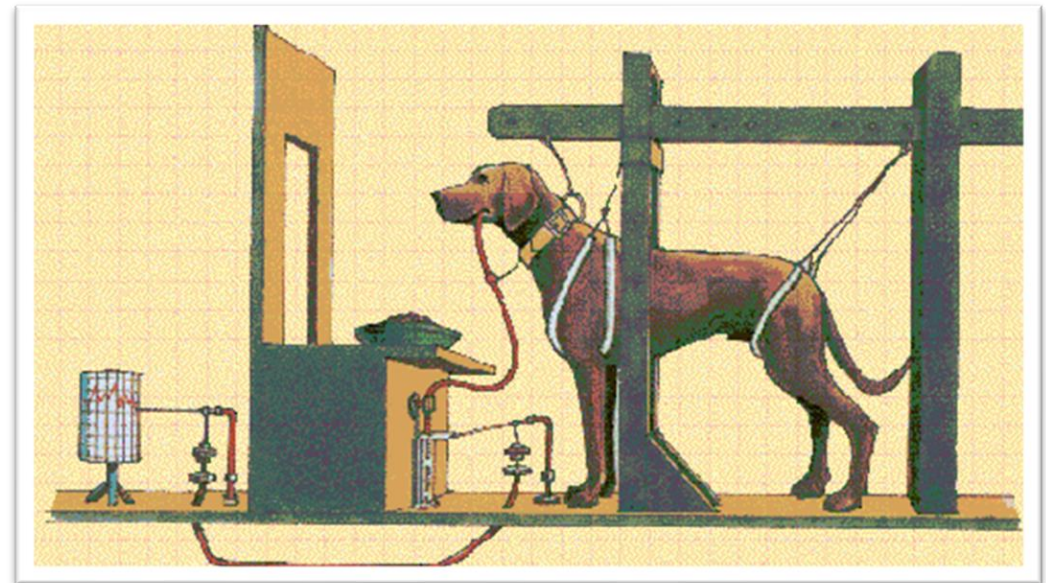

Reinforcement Theory

- Dominated the motivation literature until early 1960s.
- Conceptualizes motivation entirely in terms of **observable behaviors**.
- Assumes that **behavior is caused by events external** to the person.
- Behavior can be understood in terms of **simple laws** that apply to both human beings and animals.

Burrhus Frederic Skinner

Reinforcement Theory

- Individuals exhibit a particular behavior because
they have been reinforced (rewarded)
for that behavior in the past.
- Behavior modification:
The process of using reinforcement
principles to change behavior.

Reinforcement Theory

- Skinner (1974) defined consequences that influence the probability of behaviors:
- **Positive reinforcement** increases the probability of behaviors that they were contingent upon.
- **Negative reinforcement** increases the probability of behaviors by taking away or reducing its intensity.
- **Punishment** occurs when an unwanted outcome follows an unwanted behavior.
- **Extinction** occurs when there is the removal of a consequence following an unwanted behavior.

Reinforcement Theory

Reinforcement theory in the workplace

Positive reinforcement	Negative reinforcement	Punishment	Extinction
Provide rewards to reinforce desired behaviors EXAMPLE: Manager praising an employee	Remove aversive stimuli to reinforce behavior EXAMPLE: Eliminating tedious tasks when employee starts meeting deadlines	Deliver aversive stimuli or remove pleasant stimuli to change behavior EXAMPLES: Criticism, demotion or removing flexible work hours	Withhold valued consequences to lower negative behavior over time EXAMPLE: Manager ignoring the behavior

Reinforcement Theory

Maslow's Need Hierarchy Theory

hand-drawn by MinuteVideos.com

Maslow's Need Hierarchy Theory

Maslow's hierarchy of needs

- According to Maslow, when each of these **needs** becomes substantially satisfied, the next need becomes dominant.

Abraham Maslow

Maslow's Need Hierarchy Theory

Maslow's Need Hierarchy Theory

Maslow's hierarchy of needs

- According to Maslow, when each of these **needs becomes substantially satisfied, the next need becomes dominant.**
- It has been argued that Maslow's theory has **cultural limitations.**
- There is **no strong empirical evidence** for the hierarchy of needs.

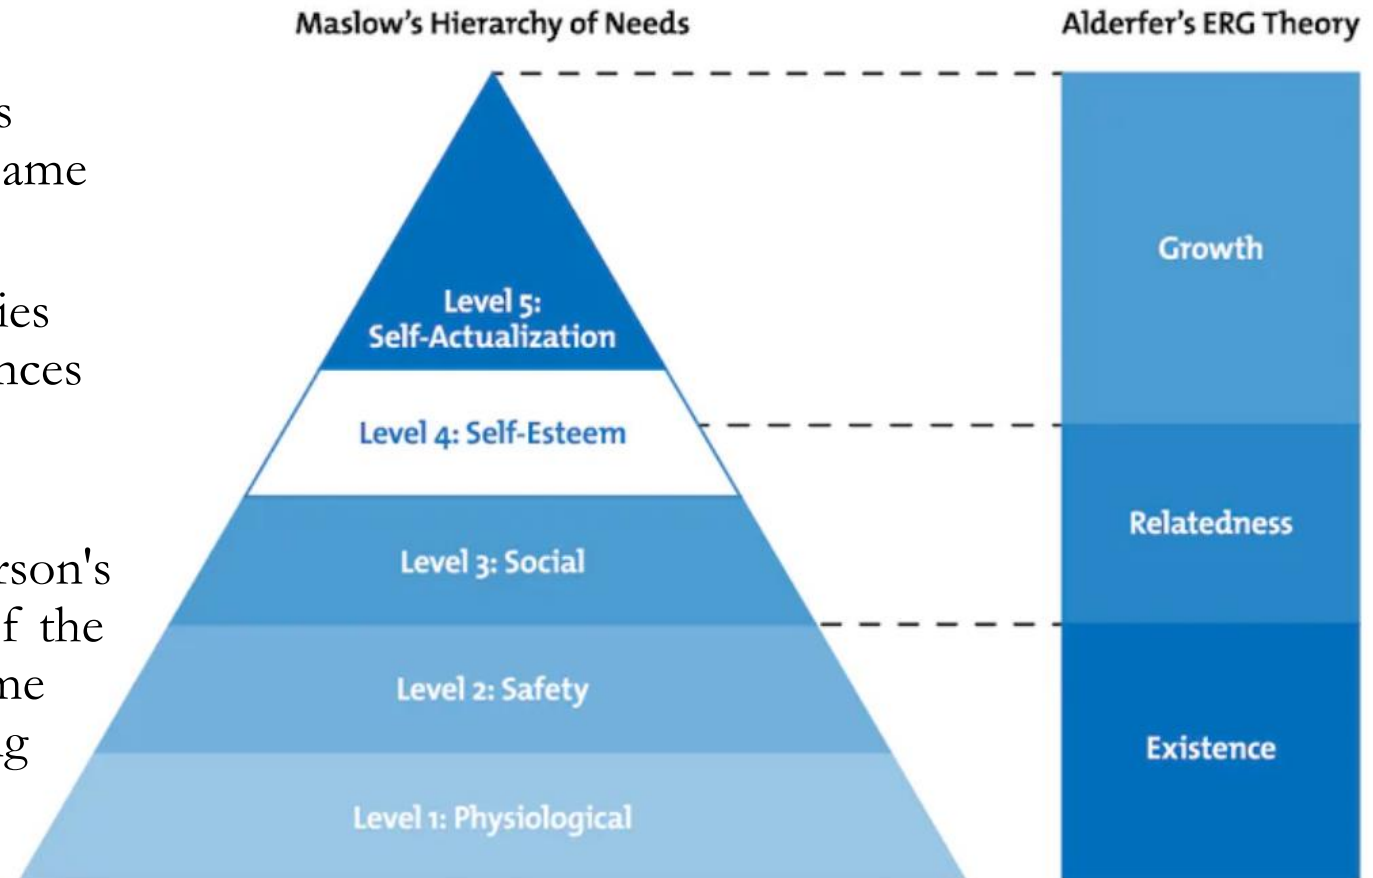

ERG Theory

Clayton Alderfer

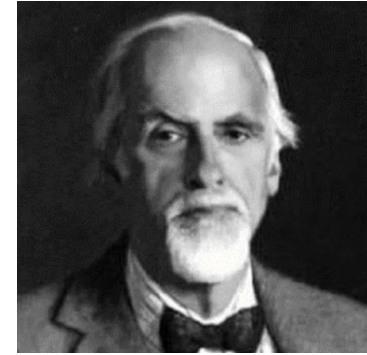

ERG theory proposes that

1. People can be motivated by needs from more than one level at the same time.
2. The importance of the needs varies for each person and as circumstances change.
3. It has a "frustration-regression" element. This means that, if a person's needs remain unsatisfied at one of the higher levels, he or she will become frustrated and go back to pursuing lower level needs.

McClelland's Theory of Needs

David
McClelland

Need for achievement

- ◆ Need to reach goals, take responsibility
- ◆ Want reasonably challenging goals

Need for affiliation

- ◆ Desire to seek approval, conform to others' wishes, avoid conflict
- ◆ Effective executives have lower need for social approval

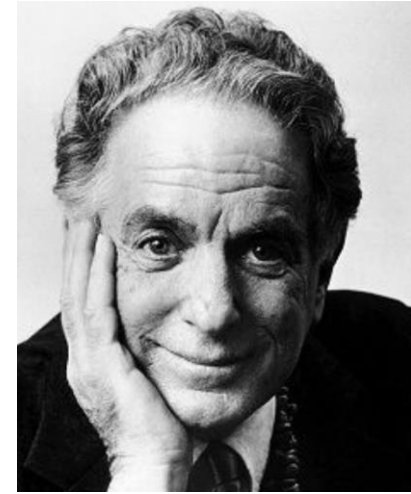

Need for power

- ◆ Desire to control one's environment
- ◆ Personalized versus socialized power

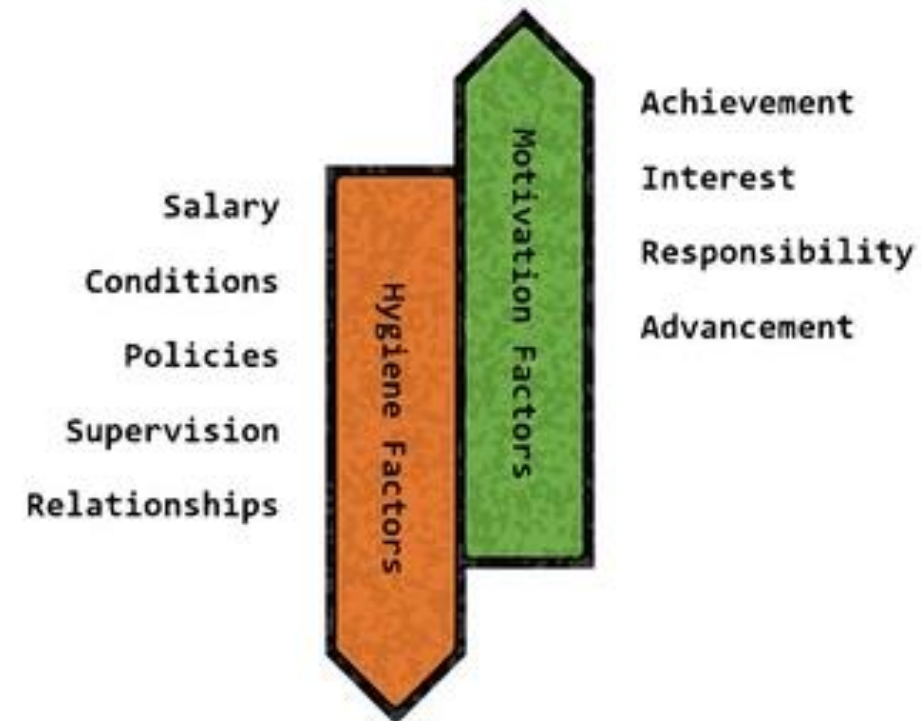

Two-factor (hygiene-motivation) Theory

- Herzberg investigated the question ‘What do people want from their jobs?’
- Results suggested that
 - **Intrinsic factors** such as advancement, recognition, responsibility, and achievements seemed to be related to **job satisfaction**.
 - **Dissatisfaction** was attributed to **extrinsic factors** such as supervision, pay, company policies, and working condition.
 - Satisfaction and Dissatisfaction are not two opposite sides of a continuum

Frederick Herzberg

Two-factor Theory

Motivators increase satisfaction:

Recognition, Responsibility,
Advancement

Satisfaction vs. No satisfaction

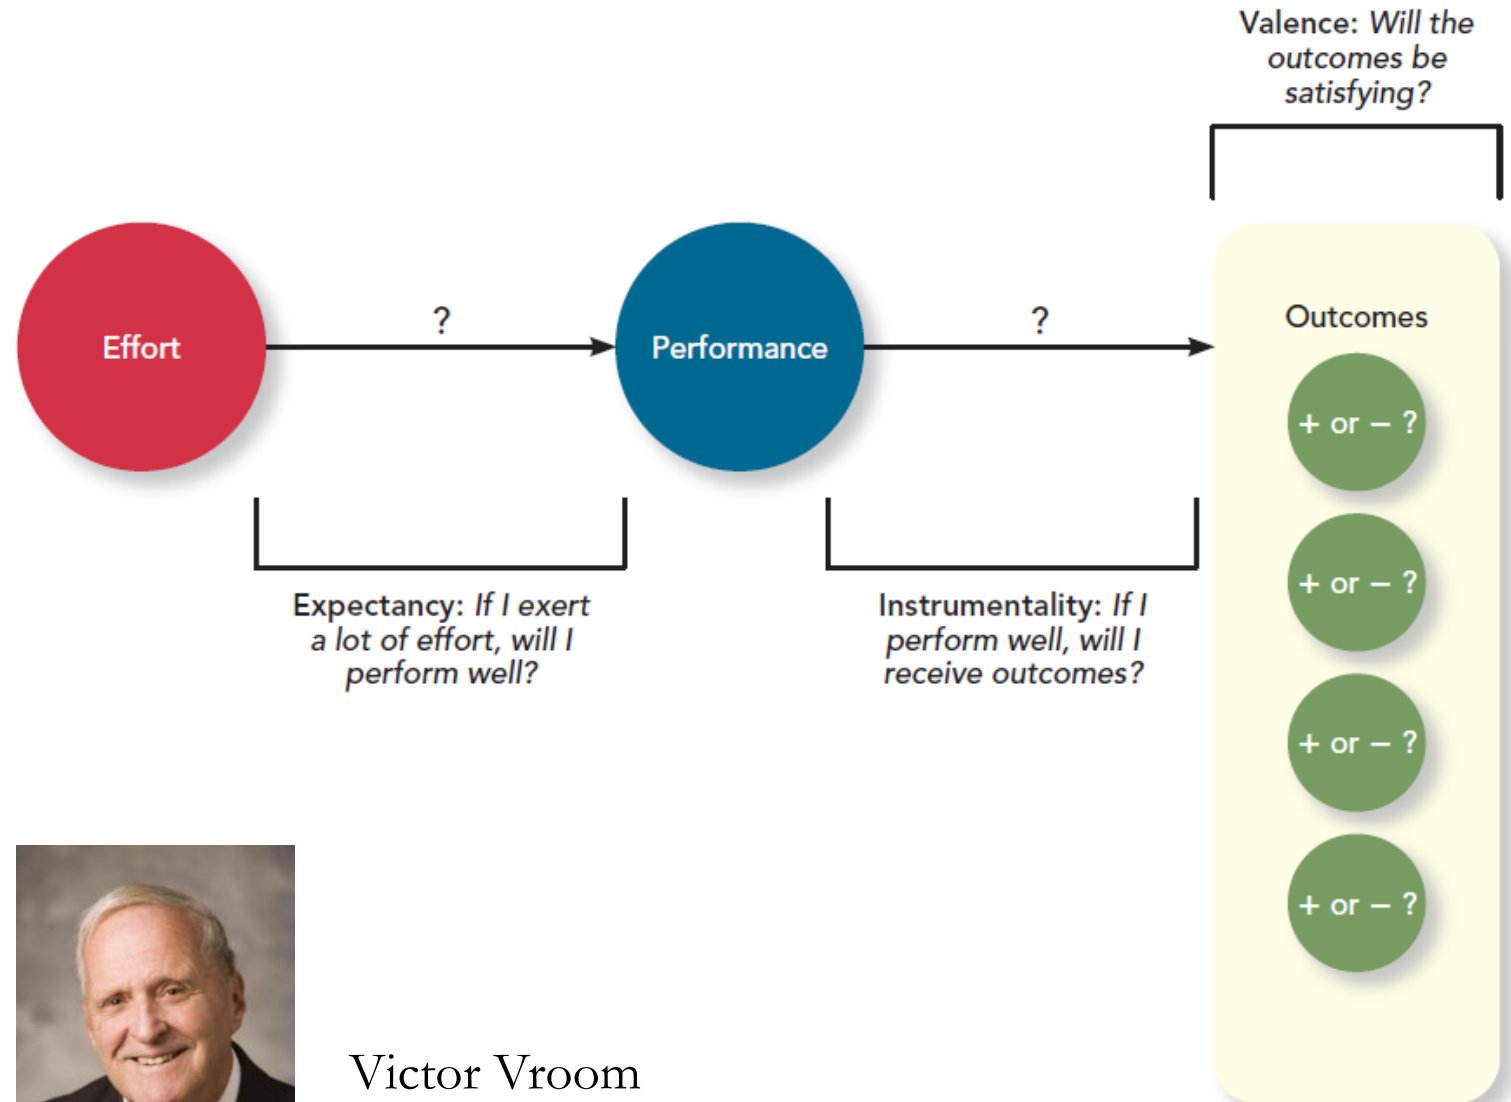

Hygiene Factors decrease dissatisfaction:

Pay, Policies, Work Condition,
Supervision

Dissatisfaction vs. No dissatisfaction

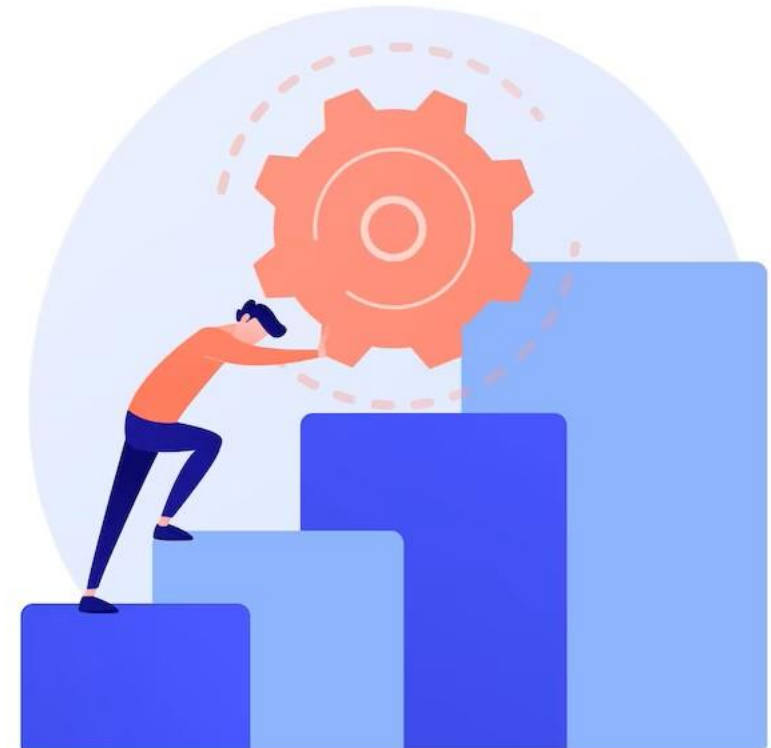

Expectancy Theory

Victor Vroom

Expectancy Theory - E to P Relationship

- Individual's perception of how probable it is that exerting effort will lead to good performance
- Following factors influence employee's perception:
 - Self-efficacy
 - Previous success
 - Help from supervisor or subordinates
 - Information
 - Proper materials and equipment
 - Proper training

Expectancy Theory - E to P Relationship

How to increase E to P expectancies?

- Assuring employees they have competencies
- Person-job matching
- Provide role clarification and sufficient resources
- Behavioural modelling
- Provide adequate training

Expectancy Theory - P to O Relationship

- Individual's perception of whether performing at a particular level would lead to attainment of a desired outcome
- Will the performance be acknowledged by those who have power to allocate resources?
- Increasing P-to-O Expectancies?
 - Measure performance accurately
 - More rewards for good performance
 - Explain how rewards are linked to performance

Expectancy Theory - Valence

- The value or importance of reward/ outcome for the individual
- The attractiveness of expected outcomes for the individual
- How to increase outcome valence?
 - Ensure that rewards are valued
 - Individualize rewards
 - Watch for countervailing outcomes

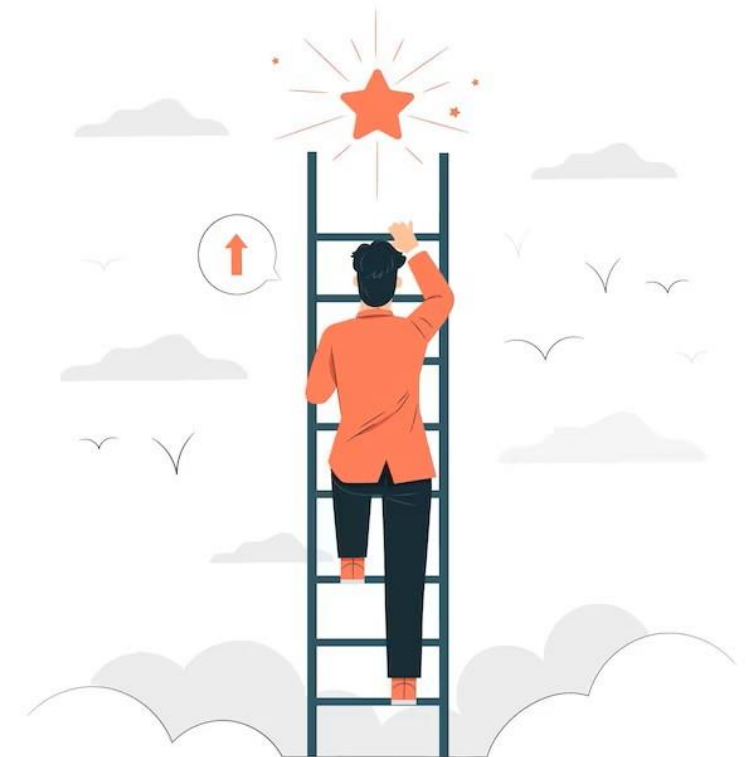

Goal Setting Theory

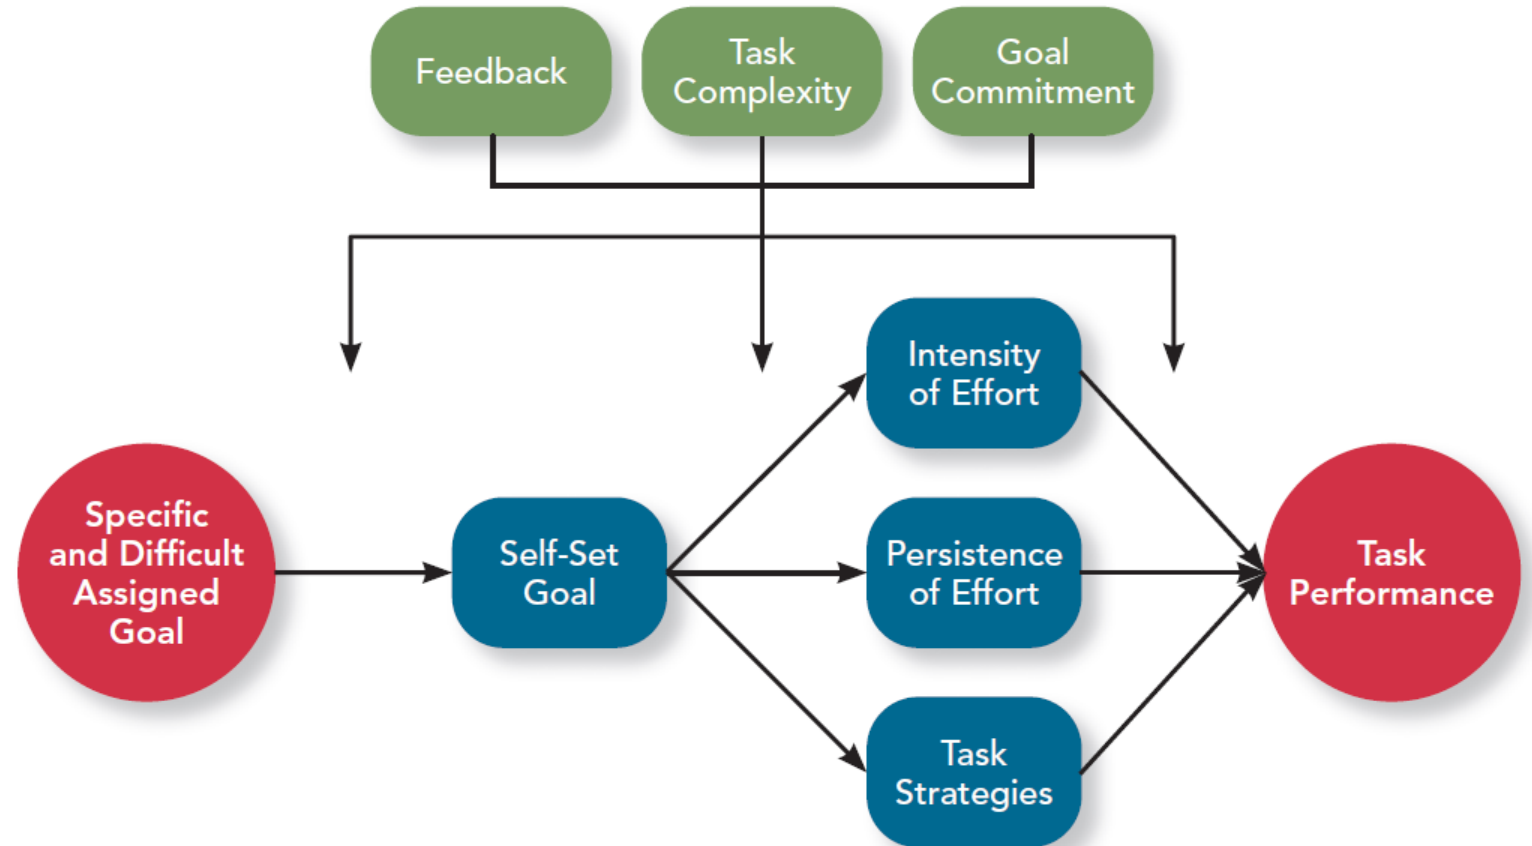

Edwin Locke

Goal setting theory views goals as the primary drivers of the intensity and persistence of effort.

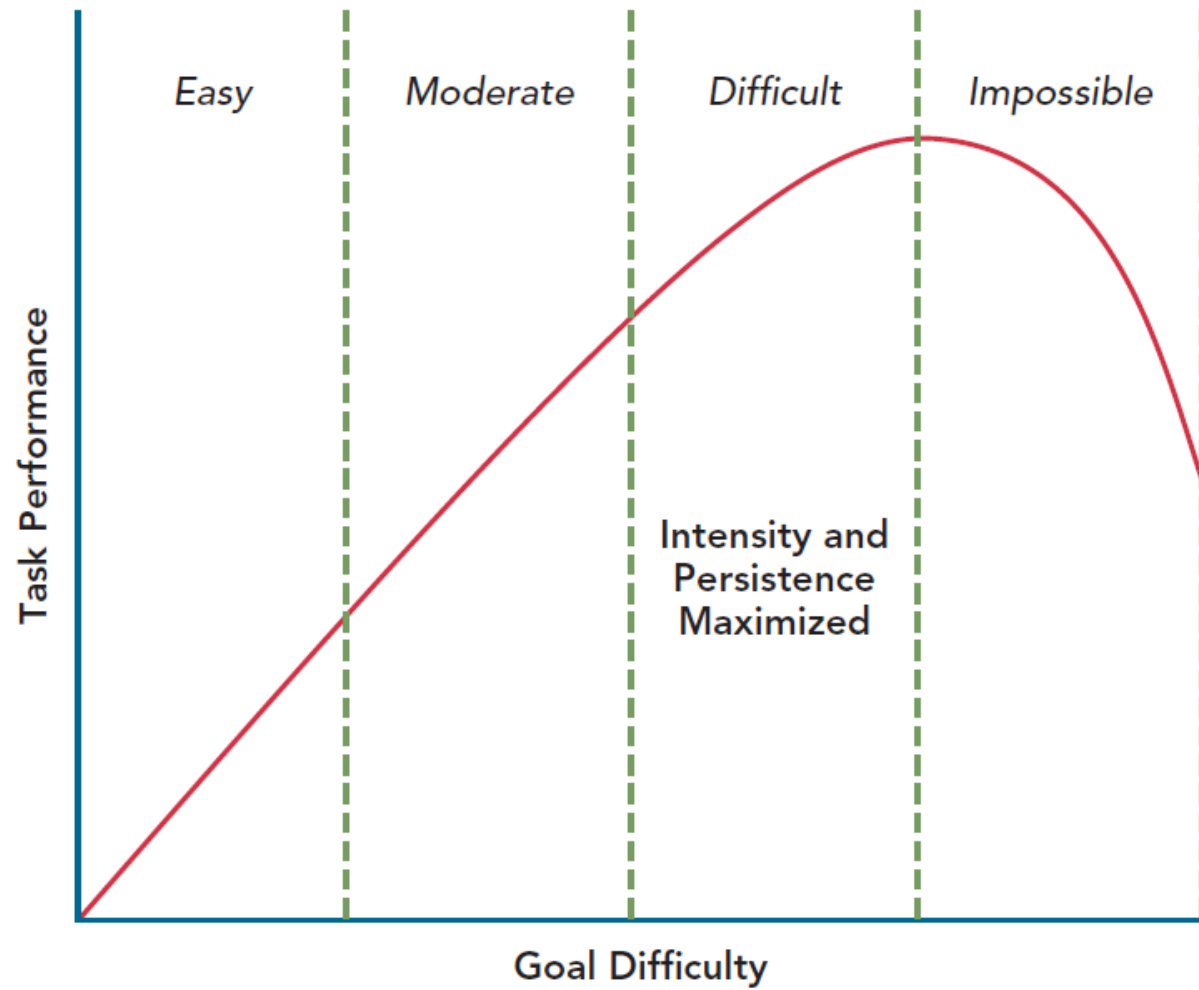

- Assigning employees **specific and difficult goals** will result in higher levels of performance
 - E.g. Double company profit levels by 2024
- What do we mean by individual self-set goals?
 - E.g. Sales rep: Increase my sales by 50% by 2024
 - E.g. Supply Chain Mgr: Decrease my costs by 50% by 2024

Goal Setting Theory

Goal Difficulty

Equity Theory

- Motivation does not just depend on your own beliefs and circumstances but also on what happens to other people.
- The ratio between input and output
- This ratio in comparison to others

John Adams

Three Possible Outcomes of Equity Theory Comparisons

COMPARISON RESULT		WAYS TO RESTORE BALANCE
Equity		
Your Outcomes Your Inputs	=	Other's Outcomes Other's Inputs No actions needed.
Underreward Inequity		
Your Outcomes Your Inputs	<	Other's Outcomes Other's Inputs Grow your outcomes by talking to your boss or by stealing from the company. Shrink your inputs by lowering the intensity or persistence of effort.
Overreward Inequity		
Your Outcomes Your Inputs	>	Other's Outcomes Other's Inputs Shrink your outcomes (yeah, right!... let's see what we can do about those inputs...). Grow your inputs through more high quality work or through some "cognitive distortion."

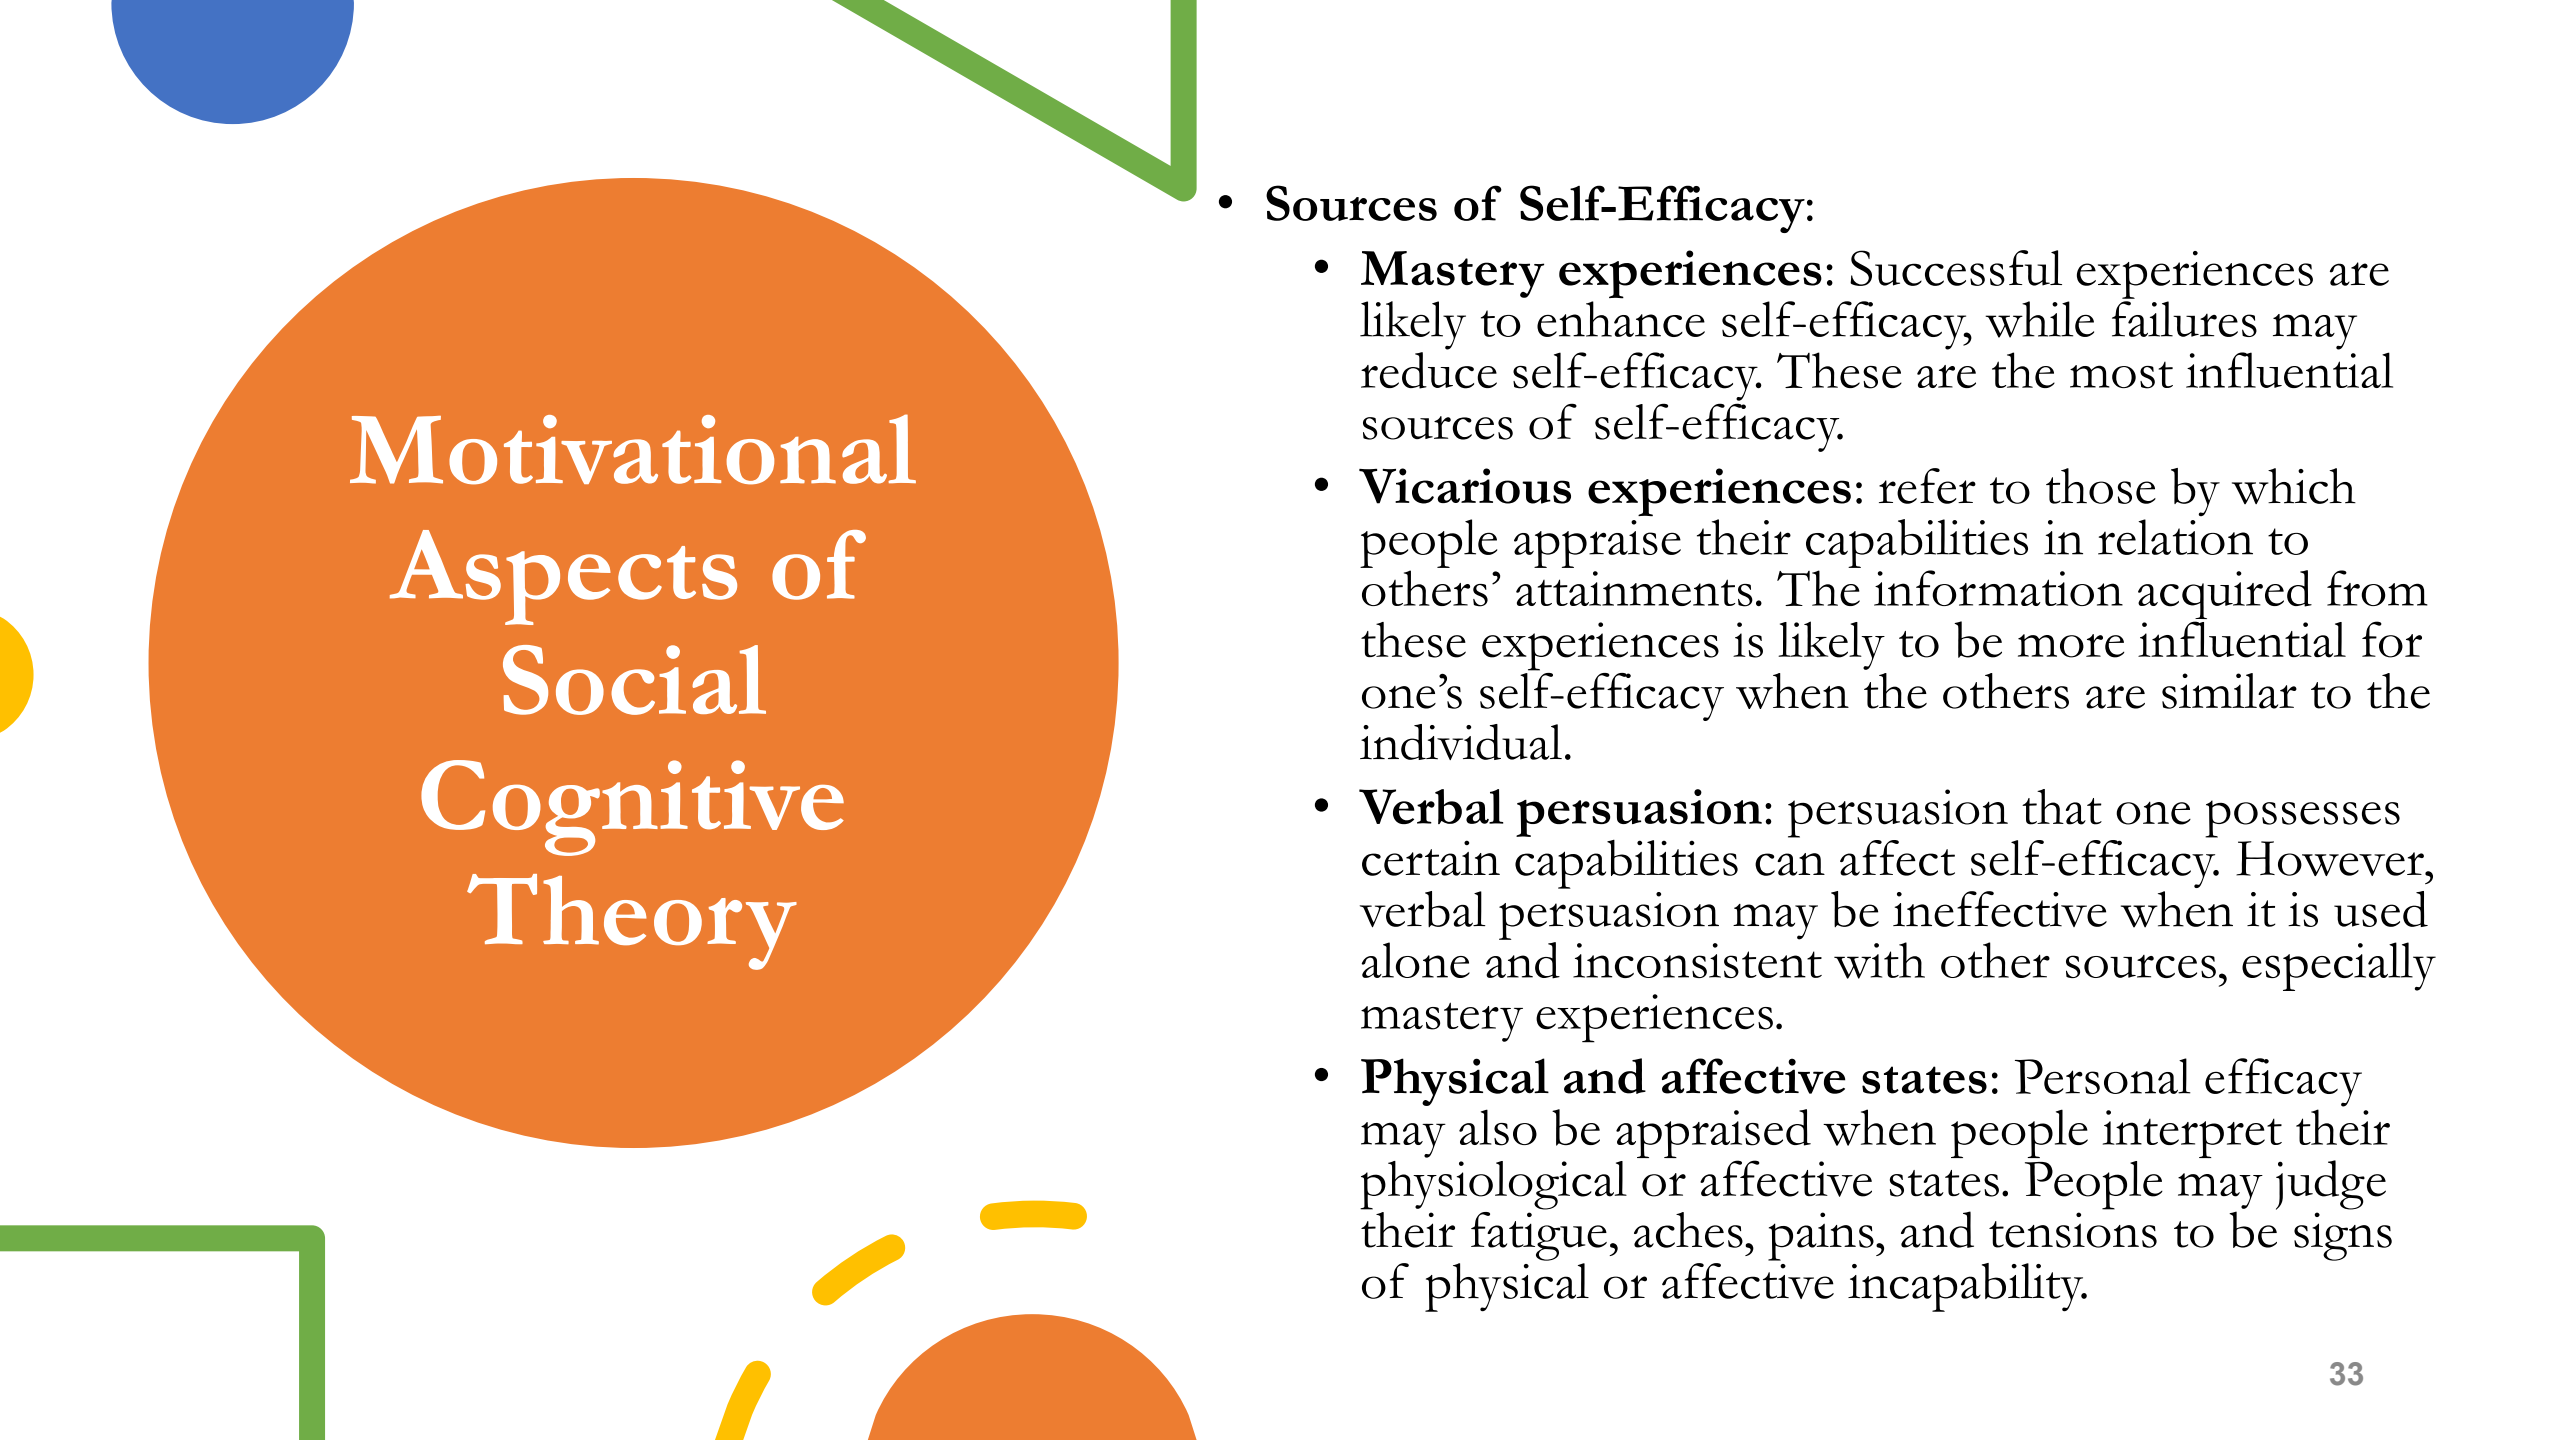

Motivational Aspects of Social Cognitive Theory

- Self-Efficacy refers to
“beliefs in one’s capabilities to organize and execute the
courses of action required to produce given attainments”
(Bandura, 1997, p. 3)
- Necessary knowledge and skills is not sufficient to perform a
task successfully, but also **high self-efficacy** is needed.

Albert
Bandura

Motivational Aspects of Social Cognitive Theory

- **Sources of Self-Efficacy:**
 - **Mastery experiences:** Successful experiences are likely to enhance self-efficacy, while failures may reduce self-efficacy. These are the most influential sources of self-efficacy.
 - **Vicarious experiences:** refer to those by which people appraise their capabilities in relation to others' attainments. The information acquired from these experiences is likely to be more influential for one's self-efficacy when the others are similar to the individual.
 - **Verbal persuasion:** persuasion that one possesses certain capabilities can affect self-efficacy. However, verbal persuasion may be ineffective when it is used alone and inconsistent with other sources, especially mastery experiences.
 - **Physical and affective states:** Personal efficacy may also be appraised when people interpret their physiological or affective states. People may judge their fatigue, aches, pains, and tensions to be signs of physical or affective incapability.

Psychological Empowerment

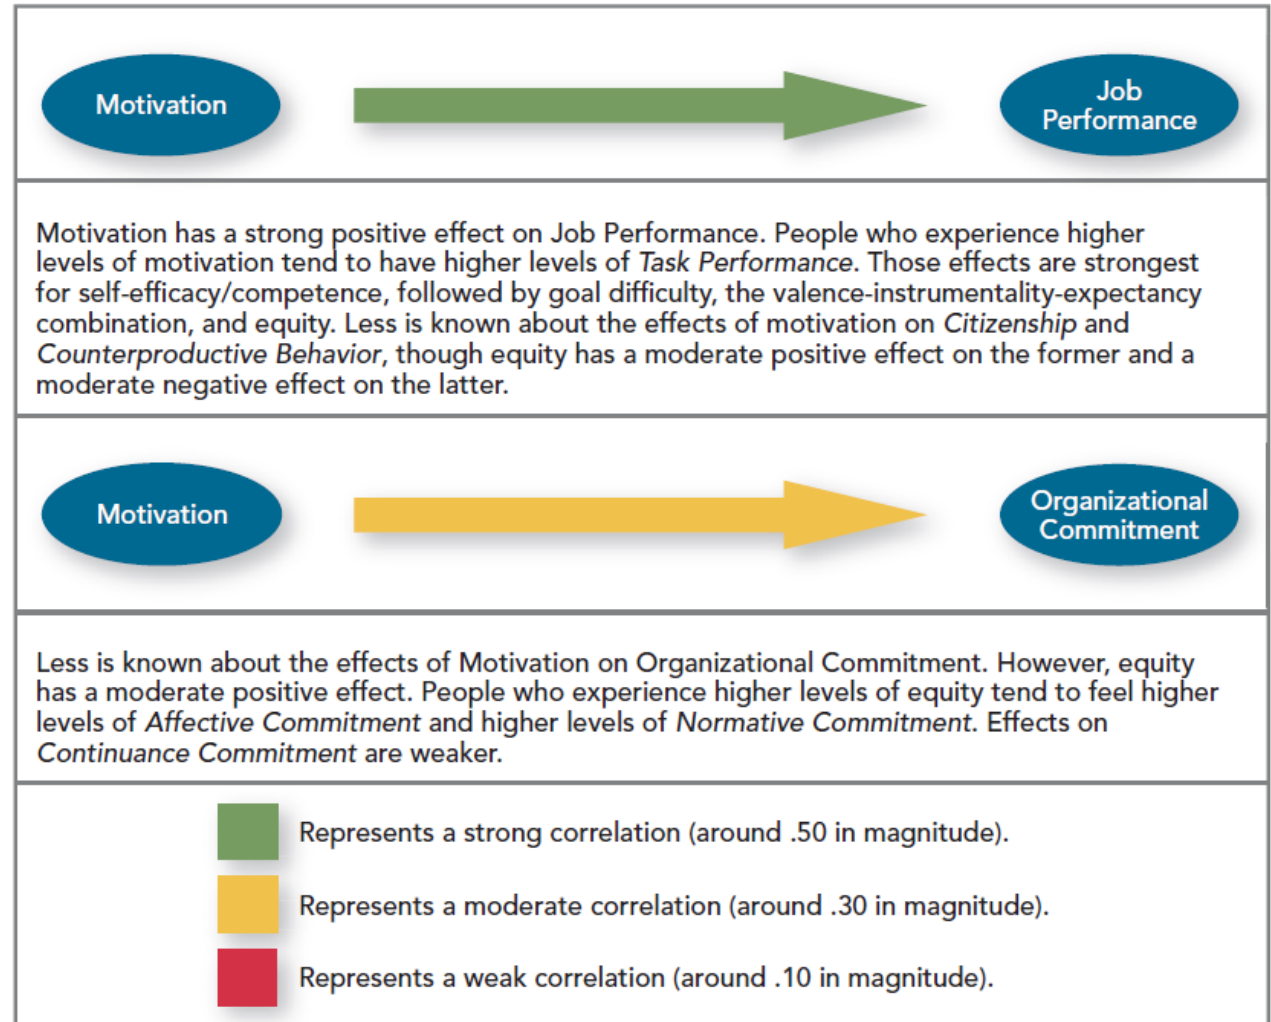

Psychological empowerment: an energy rooted in the belief that work tasks contribute to some larger purpose.

- Work is empowering when it contains:
 - **Meaningfulness:** the value of a work goal relative to a person's own ideals and passions.
 - **Self-determination:** a sense of choice in the initiation and continuation of work tasks.
 - **Self-efficacy/Competence:** a person's belief in his or her capability to perform work tasks successfully.
 - **Impact:** the sense that a person's actions “make a difference”—that progress is being made toward fulfilling some important purpose.

Effects of Motivation

- Motivation has a **strong** effect on job performance (mostly task performance).
- Equity has a **moderate** effect on organizational commitment (affective and normative commitment).
